Abstract

Caesarean section scar pregnancy is an ectopic pregnancy of cervico-isthmic and cicatricial localization. It corresponds to implantation of the gestational sac in the scar or dehiscence of a previous caesarean section. In this article, we present the case of a patient diagnosed with scar pregnancy in the first trimester who benefited from conservative treatment. Pregnancy on a caesarean section scar is no longer an exceptional event. The advantage of early diagnosis lies in the possibility of choosing an appropriate treatment based on the clinical context, radiological data, technical resources and the patient's wishes.

Keywords: caesarean section scar pregnancy; conservative treatment; ectopic pregnancy
